

Last mile delivery audit

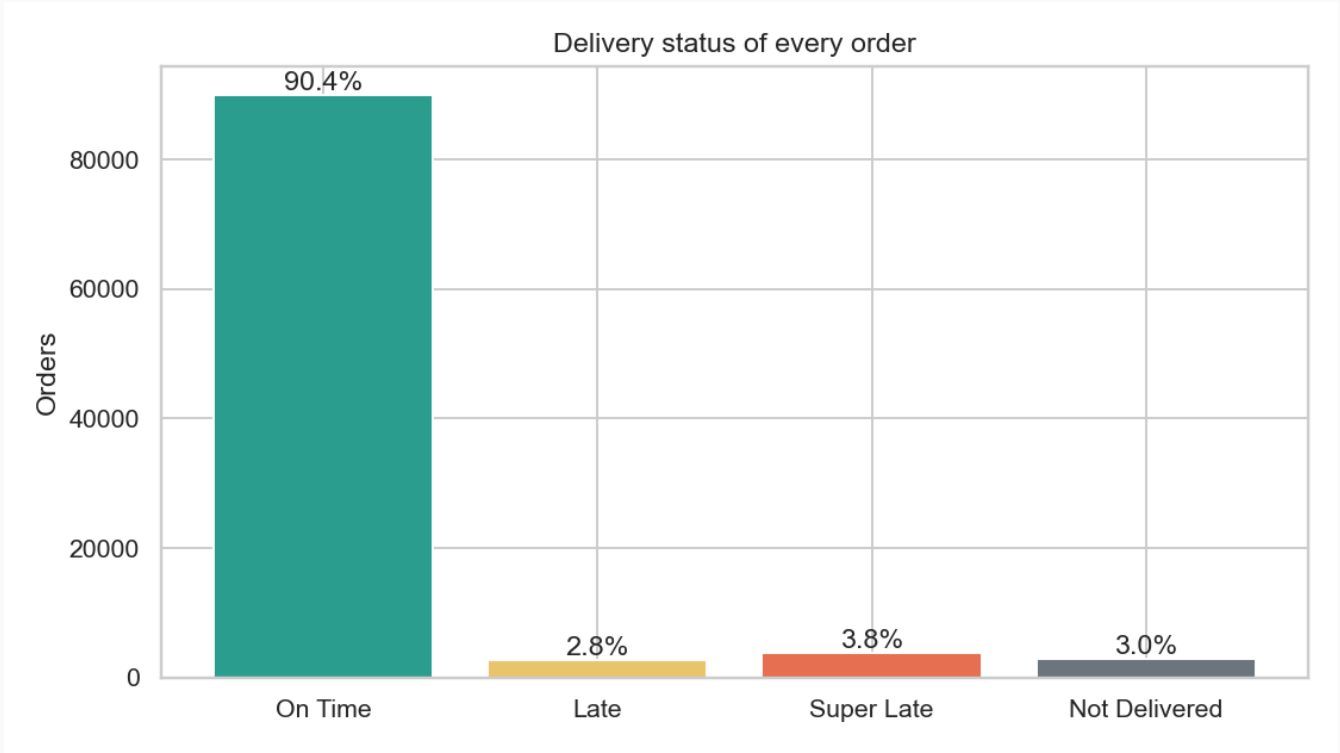

Are we failing specific regions, or the whole country?

- Of 96,470 packages that arrived, 6.8% missed the promised day.
- The typical package still arrived 12 days early.
- The miss is regional: the Northeast and Rio, not Brazil as a whole.
- Late packages sit next to lower reviews. That is a pattern, not a cause.

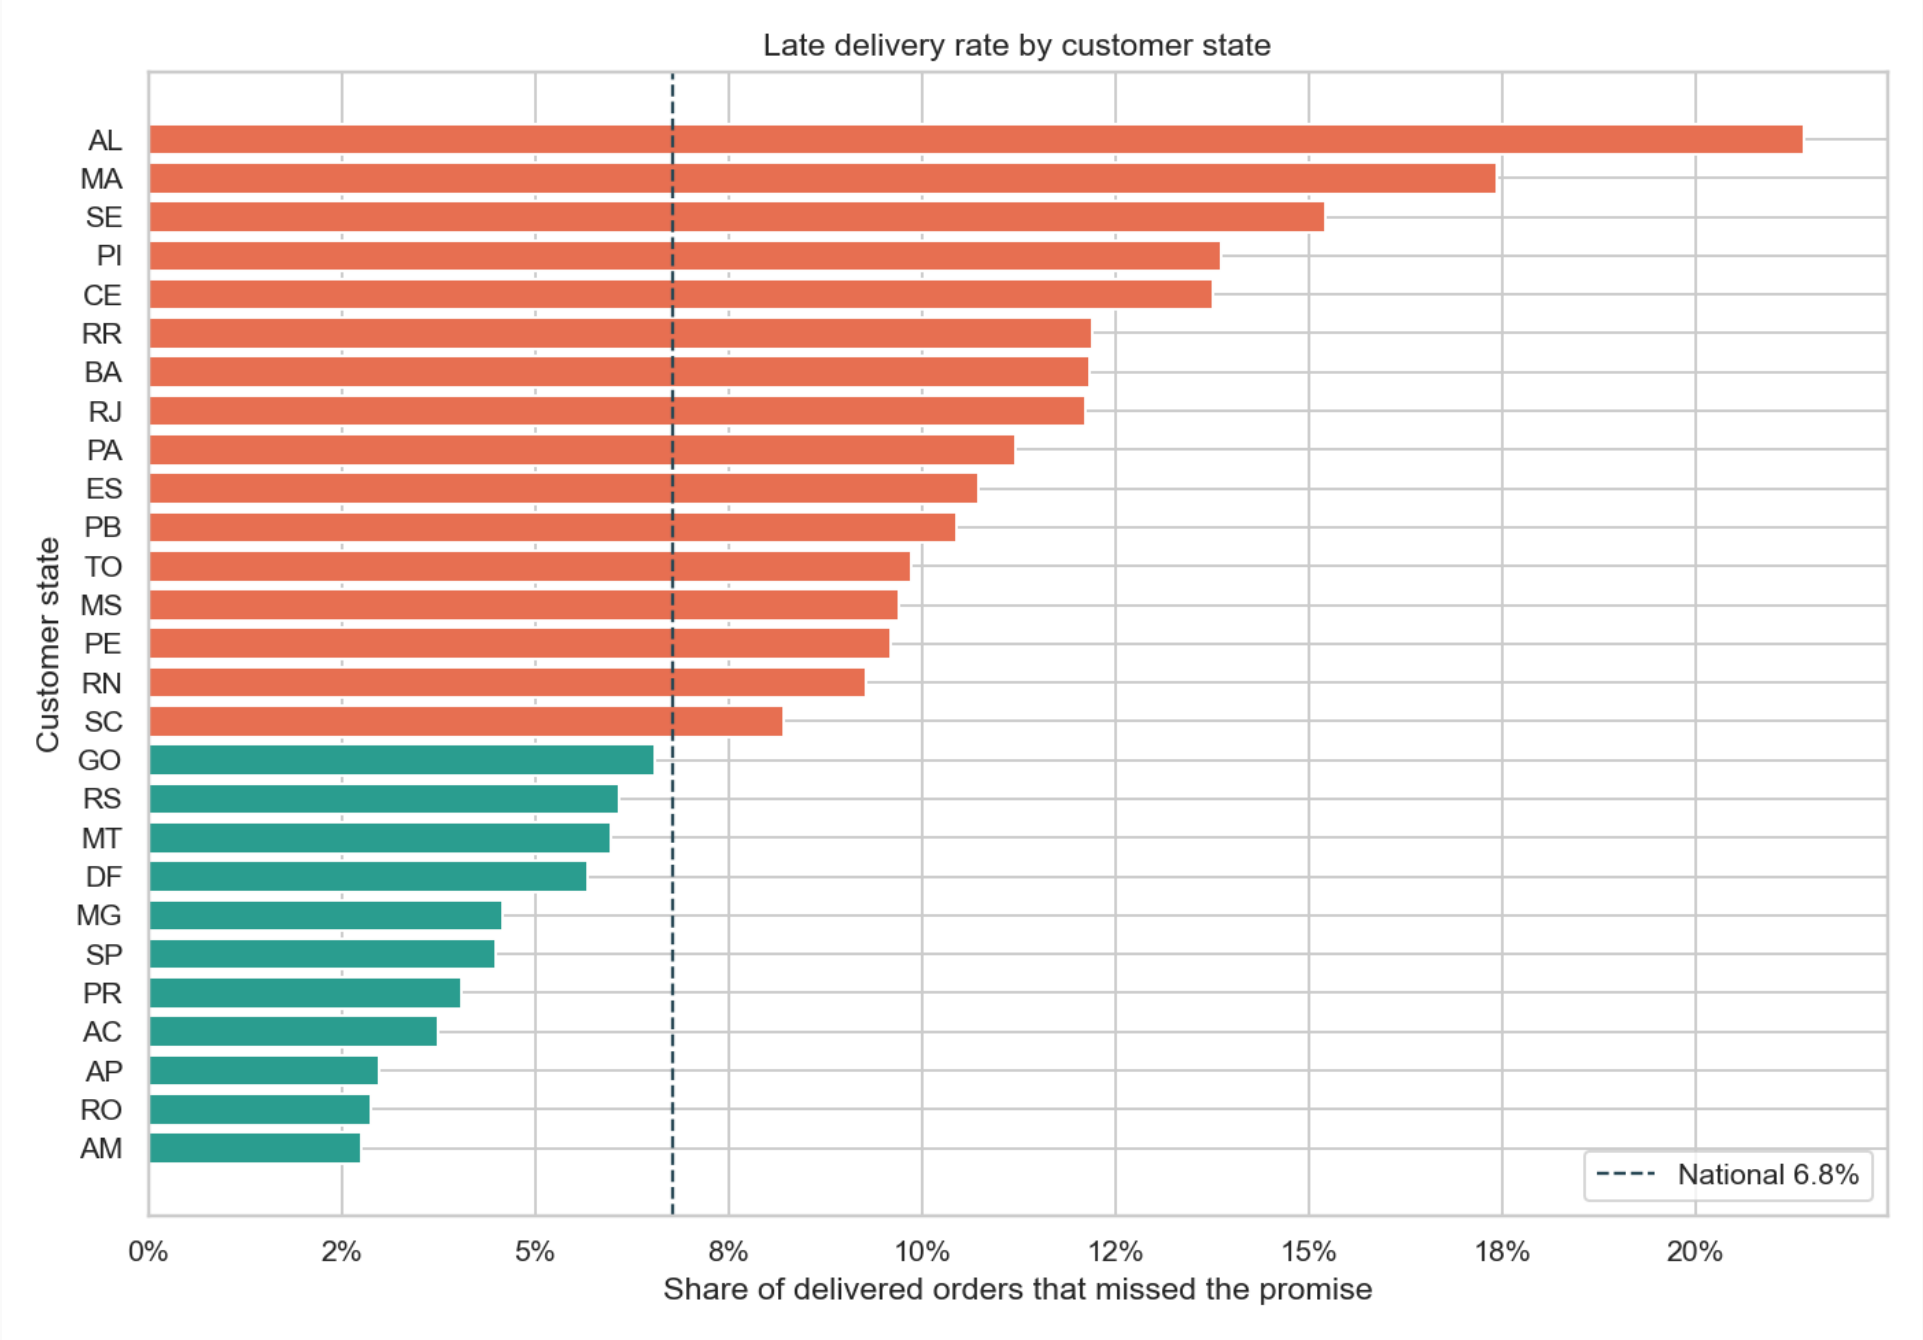

Olist public orders, September 2016 to October 2018. Product of the delivery performance audit.

The country is mostly on time

Late means the arrival calendar day is after the promised day. Super late means more than five days.

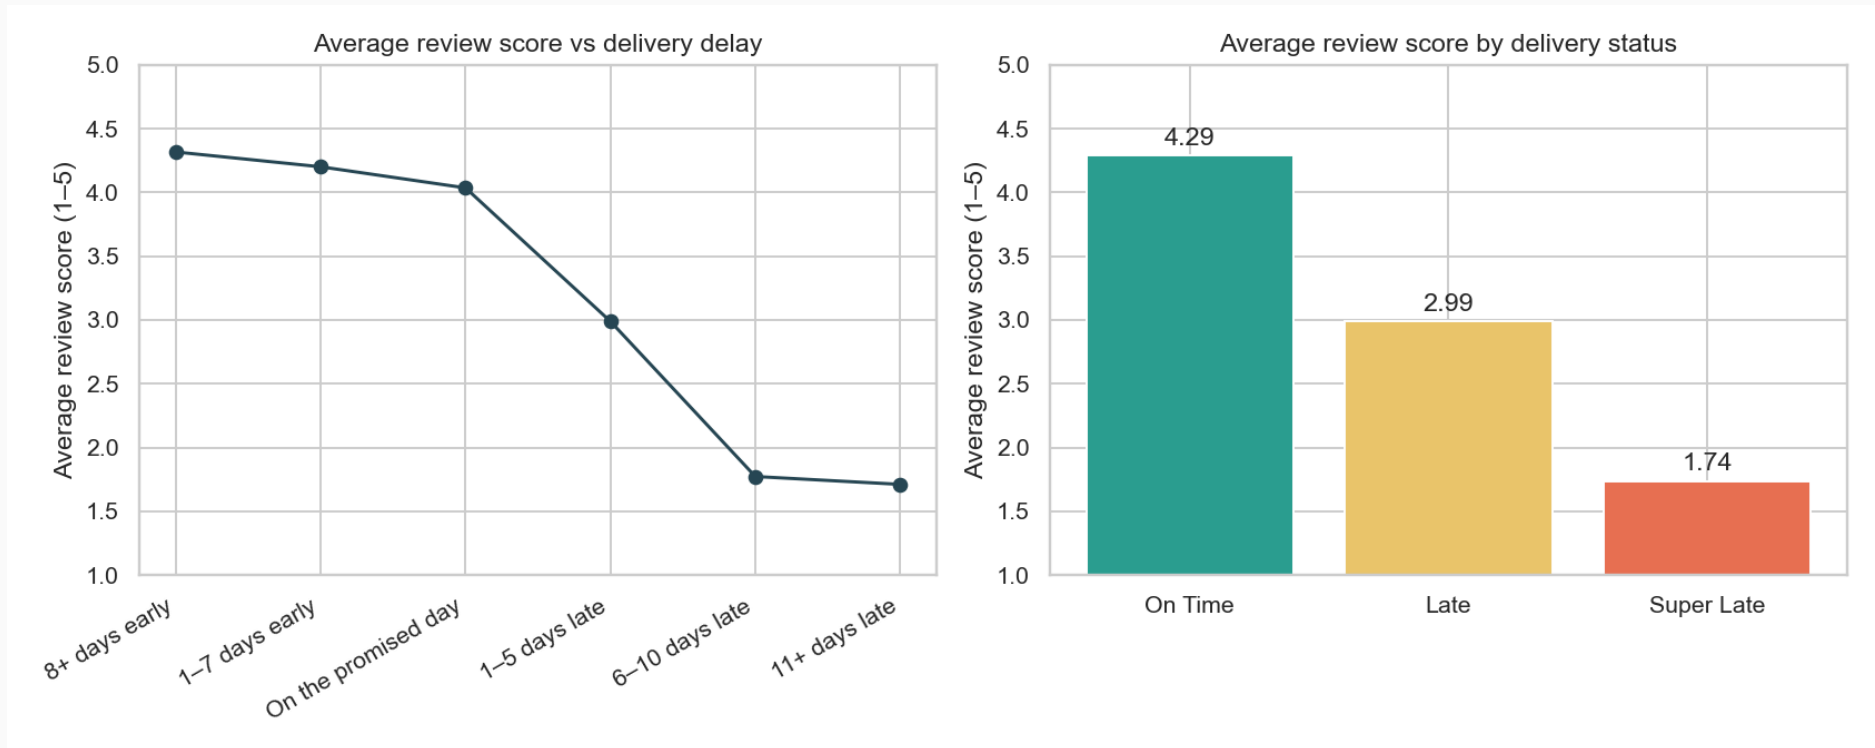

The miss is in some states

A missed day sits next to a lower score

4.29 on time, 2.99 when one to five days late, 1.74 when more than five days late.

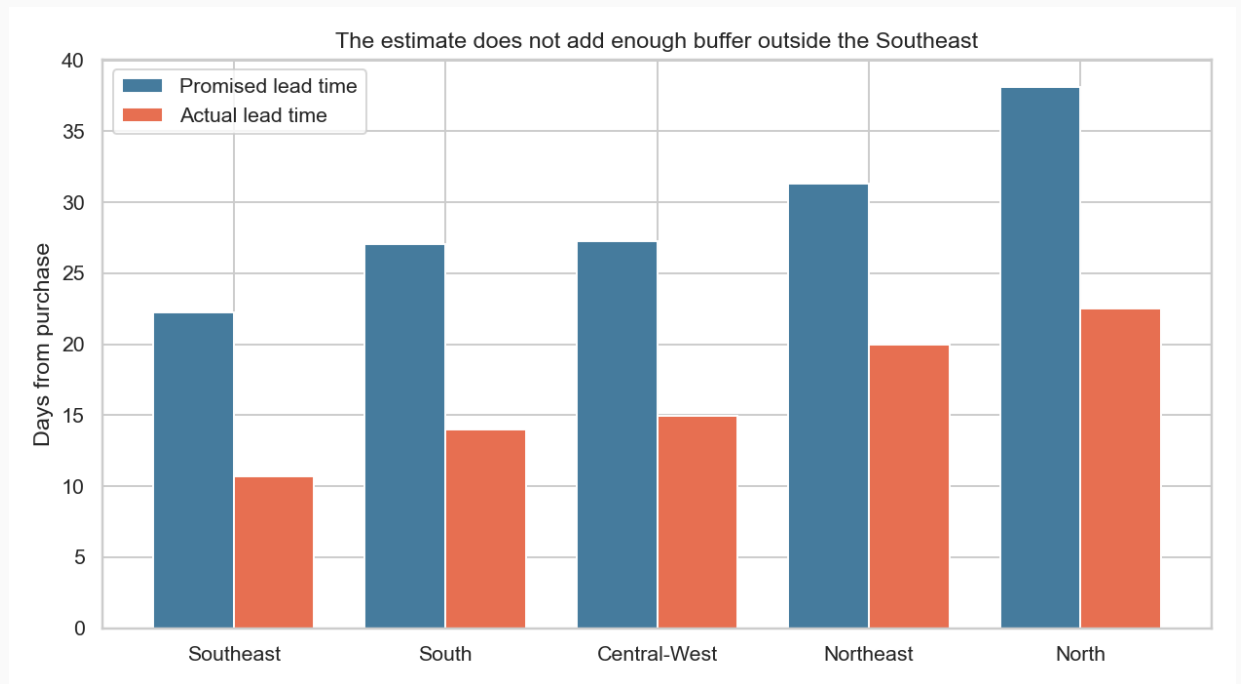

The date was not widened for the longer trip

Candidate's choice: promised lead time against the days the trip actually took.

The Northeast was promised about 31 days for a trip of about 20. The cushion stayed near 11 days, the same as the Southeast, where the trip takes about 11 days.

The North was given a wider day and misses less often (8.6%) on a longer road.

What to do first

The file shows where the promised day fails. It does not show why the road is slow.

- Give a later day in the Northeast and in Rio de Janeiro.
- Treat a package that leaves the seller's state differently: 8.0% late, against 4.5% when it stays.
- Do not rank a state by rate alone. Alagoas is 21.4% on 397 deliveries. Roraima, Acre, and Amapá are under 100.
- A later date will not clear every weak review. Most 1- and 2-star reviews are still on time.
- 2,971 orders have no arrival. They stay in the file and are left out of the 6.8% rate.
